1. Summary

We reviewed the mobile homepage of cadillacmarin.com using the Google PageSpeed Insights report generated on October 11, 2026 (emulated Moto G Power, slow 4G, Lighthouse 13.5.0), together with the homepage and contact page content. Everything in this document is either visible in that report or on the live pages. Anything we could not confirm is marked **to verify**.

The short version: the site has a strong search foundation and stable layout, but the mobile page is slow to become usable. The main cause appears to be the amount of JavaScript and third-party tags the page loads, not the design itself. These are fixable steps that do not require changing the look of the site.

28	86	92	100	2/3
Performance	Accessibility	Best Practices	SEO	Agentic Browsing

Key metrics (mobile)

Metric	Real-user data (28 days)	Lab test (this run)
Largest Contentful Paint	4.6 s (needs improvement)	20.1 s
First Contentful Paint	4.2 s	4.7 s
Time to First Byte	3.8 s	not reported
Total Blocking Time	not reported	2,330 ms
Speed Index	not reported	15.3 s
Cumulative Layout Shift	0.01 (good)	0.005 (good)
Interaction to Next Paint	N/A (not enough data)	not reported

Core Web Vitals assessment on mobile: **Failed**. Source: PageSpeed Insights report generated Oct 11, 2026, 12:54 PM (GMT+5). Scores vary between runs, so treat them as indicative and re-test after changes.

2. Screenshot evidence

Taken directly from the PageSpeed Insights report supplied for this audit.

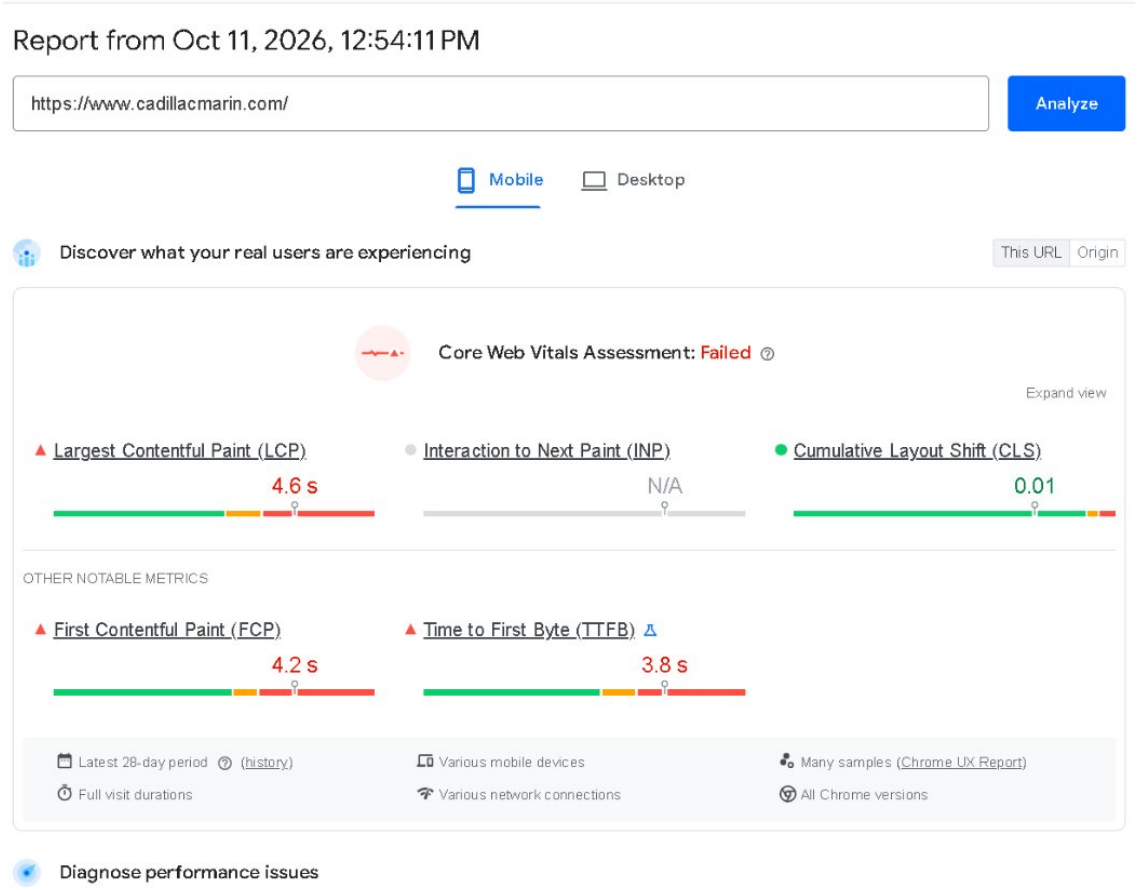

Figure 1. Real-user Core Web Vitals (mobile): LCP 4.6 s, FCP 4.2 s, TTFB 3.8 s; assessment failed.

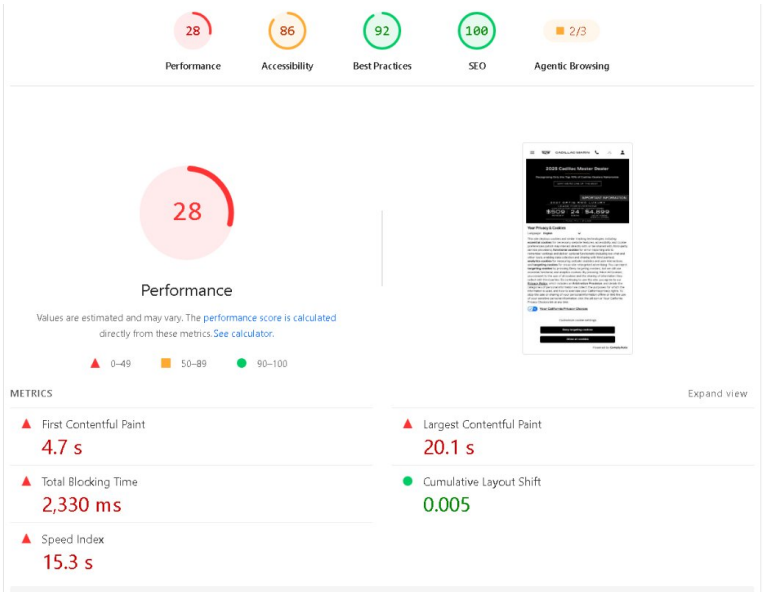

Figure 2. Category scores and lab metrics. The first-load filmstrip shows a large privacy and cookie panel covering the top of the mobile screen (to verify on a real device).

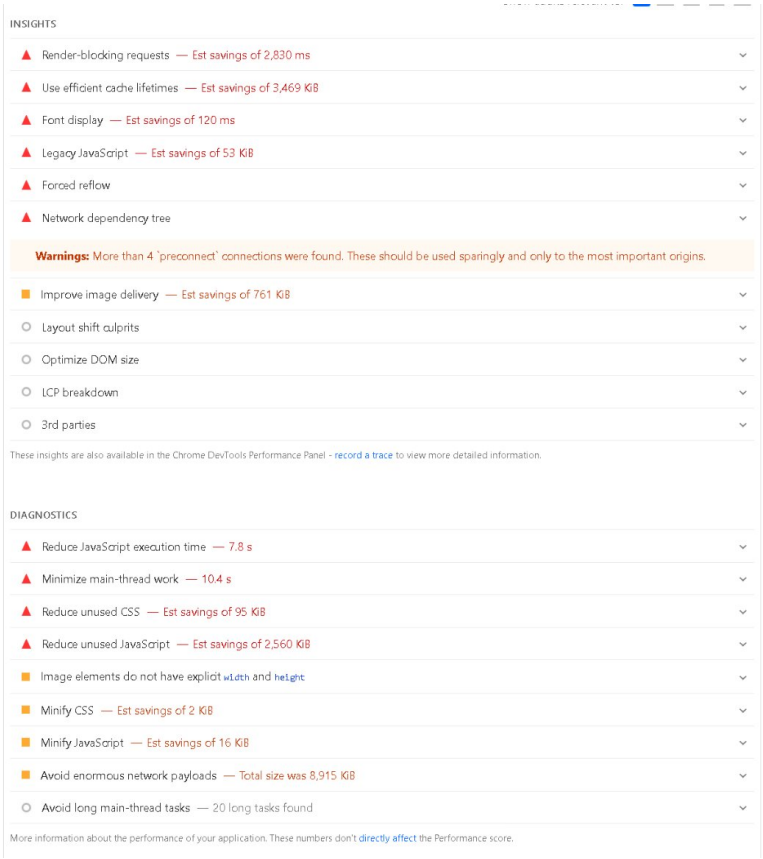

Figure 3. Insights and diagnostics: render-blocking requests (est. 2,830 ms), JavaScript execution 7.8 s, main-thread work 10.4 s, unused JavaScript 2,560 KiB, total payload 8,915 KiB.

3. Issues and recommended fixes

Ordered by impact on mobile visitors. Priority reflects effect on speed, usability and lead generation.

Area	Finding	Priority	Recommended fix
Performance	Mobile Core Web Vitals fail: LCP 4.6 s, FCP 4.2 s and server response (TTFB) 3.8 s in real-user data.	**High**	Cut the critical path: reduce server response time, preload the hero image, and defer everything not needed for the first screen.
Performance	Heavy JavaScript: 7.8 s execution, 10.4 s main-thread work, 2,330 ms Total Blocking Time, 20 long tasks, 2,560 KiB unused JavaScript.	**High**	Remove or defer scripts that do not serve the first screen; load widgets (chat, reviews, trade-in) on interaction.
Performance	The homepage source references six separate Google Tag Manager containers. This is a likely contributor to the script load (to verify with a performance trace).	**High**	Audit which tags fire, merge containers, and remove duplicates and unused tracking.
Performance	Render-blocking requests (est. 2,830 ms) and font display delay (est. 120 ms). More than 4 preconnect hints were found.	**High**	Inline critical CSS, defer the rest, keep preconnect to the most important origins only.
Performance	Page weight is 8,915 KiB; better image delivery could save about 761 KiB; cache lifetimes could save 3,469 KiB on repeat visits.	**Medium**	Serve right-sized WebP/AVIF images, lazy-load below the fold, set long cache lifetimes for static files.
Content	An expired promotion is still shown: the MyFirstEV banner says delivery must take place by 09/30/2026, yet it was displayed on October 11, 2026.	**High**	Remove or replace it, and add expiry dates to promo banners so they retire automatically.

Area	Finding	Priority	Recommended fix
Mobile UX	A privacy and cookie panel covers the top of the mobile screen on first load (seen in the PageSpeed filmstrip; to verify on a real device). The browser also requests geolocation permission on page load.	**Medium**	Use a compact bottom consent bar. Ask for location only after a visitor taps "directions" or "near me".
Content	Homepage promo banners are image-only. The charger-offer banner has the alt text "PG&E;" and the hero banner uses a file-style alt ("Cadillac-homepage-banner"), so offers are not readable by search engines or screen readers.	**Medium**	Use live text over background images and write descriptive alt text that matches the offer.
Navigation	Duplicate or inconsistent links: XT5, VISTIQ and Retired Loaner Vehicles each appear twice in the New menu; OPTIQ points to two different URLs; Schedule Service links to three different URLs.	**Low**	Consolidate to one canonical link per destination.
Contact	The contact page offers a web form and phone numbers only; no email address, chat or text option is listed (a chat widget may load via script: to verify).	**Medium**	Add a visible text/chat or email option next to the phone numbers for visitors who do not want to call.
Accessibility	Insufficient colour contrast, touch targets too small or too close, heading order not sequential, iframes without titles, ARIA roles missing their required parent. The accessibility tree is flagged as not well-formed (Agentic Browsing 2/3).	**Medium**	Fix the flagged elements one by one; re-run the accessibility audit and a keyboard and screen-reader pass.
Best practices	Browser errors are logged to the console. Security headers (CSP, HSTS, COOP, frame protection, Trusted Types) are listed for manual review.	**Low**	Resolve console errors; review headers with the platform provider (these may be controlled at platform level).
Performance	Image elements do not have explicit width and height; unused CSS (95 KiB) and legacy JavaScript (53 KiB) were also flagged. Layout shift is currently good, so this protects it.	**Low**	Add width/height to images and trim unused CSS and legacy polyfills.

4. UI review

The current design is clean, brand-appropriate and easy to scan, which is worth keeping. Observations that affect mobile visitors:

- **First screen:** on a phone, the first view is dominated by a banner and a privacy panel, so the dealership name, phone numbers and primary actions are pushed down (to verify on a real device).
- **Repeated blocks:** the model selector (Electric, Sedans, Crossovers & SUVs) appears twice on the homepage, which adds page weight without adding choice.
- **Offers:** lease and finance offers are strong content, but they sit inside image banners. Showing the key number (for example the monthly payment) as live text would make them easier to read, link to and update.
- **Direct actions:** call, directions and service booking are available, but a persistent bottom action bar on mobile would keep them one tap away at any scroll position.

5. What already works well

- SEO scores 100/100, with title, meta description and a clear H1 in place.
- Layout stability is excellent (CLS 0.01 real-user, 0.005 lab): content does not jump while loading.

- Sales, Service and Parts phone numbers are clear in the header and on the contact page, and department hours are listed.
- Strong service funnel: online service scheduling, finance application, trade-in valuation and EV test drive are all easy to find.
- Rich, useful content: full model lineup, certified pre-owned benefits, current offers, and premium pick-up and delivery.
- The footer copyright shows the current year (2026), and a BBB review link and a "Top Rater Dealer 2026" badge build trust.

6. Four-week action plan

Week	Focus	Actions
1	Quick wins	Retire the expired MyFirstEV banner. Audit the six tag containers and pause unused tags. Stop the geolocation prompt on load. Replace the large privacy panel with a compact bar.
2	Speed	Defer non-critical JavaScript and CSS. Resize and convert images, add width/height, lazy-load below the fold, preload the hero image. Set long cache lifetimes.
3	Accessibility and content	Fix contrast, touch targets, heading order, iframe titles and ARIA. Write descriptive alt text. Turn banner offers into live text. Consolidate duplicate menu links.
4	Verify and extend	Re-run PageSpeed and compare with this baseline. Add a mobile action bar and a text/chat option. Review security headers with the platform provider.

Note: the site appears to run on the Dealer Inspire dealer platform (credited in the footer). Some changes may need to go through the platform provider; we can prepare an exact change list for them.

7. Demo homepage

To show what a faster, more focused mobile homepage could look like, we built a concept for the Cadillac Marin homepage using only information that is on your current site (models, offers listed on October 11, 2026, services, hours, phone numbers and address).

View the demo: https://softosync.github.io/client-demos/cadillac-marin/

- One lightweight page with no third-party libraries and explicit image sizes.
- A mobile bar that keeps Call Sales, Service and Directions one tap away.
- A live open/closed status for Sales, Concierge, Service and Parts, based on your listed hours (Pacific time).
- Offers shown as live text, with links to the full terms on your current offers page.

The demo is a concept only: it is not the live website, is not indexed by search engines, and all vehicle and offer links go to cadillacmarin.com.

8. Next steps

We suggest a phased approach: **Phase 1** performance and tag clean-up (weeks 1 to 2), **Phase 2** accessibility and content fixes (weeks 3 to 4), and **Phase 3** optional improvements. Pricing is agreed per phase after a short scoping call.

Beyond the website, Softosync also builds **AI automation** (for example, an AI assistant that answers calls and books service appointments), **mobile apps**, and **Tallo ERP** for managing day-to-day operations. If any of these are useful to the dealership, we are happy to talk it through.

Prefer chat? Message us on **WhatsApp Business at +92 308 2615761**, or call the same number, whichever you are more comfortable with.
