Speed, search visibility and booking: the next gains

Prepared by Muhammad Zain, Softosync (softosync.com)

Date: 10 October 2026 | Data source: Google PageSpeed Insights (mobile) and a read of the live homepage

1. Summary

Shenton Dental Surgery already has a clear, trustworthy website: a visible booking button, Google reviews, doctor credentials and a WhatsApp shortcut. This audit is therefore not a case for starting over. It points to a small number of fixes that can make the site faster on phones, easier to find locally, and quicker for patients to book.

Google PageSpeed Insights, mobile (run on 10 Oct 2026)

Category	Result	Reading
Performance	61	Needs work. Slow loading on a phone connection.
Accessibility	95	Good. Heading order and aria-hidden issues to tidy.
Best Practices	96	Good. Browser console errors to check.
SEO	92	Good. No meta description found.
Agentic Browsing	1/2	Accessibility tree not well-formed for AI agents.

Core timings (mobile)

Metric	Result	Status
First Contentful Paint	3.2 s	Slow
Largest Contentful Paint	10.8 s	Slow
Speed Index	8.4 s	Slow
Total Blocking Time	0 ms	Good
Cumulative Layout Shift	0.001	Good

Test conditions as shown in the report: emulated Moto G Power, slow 4G throttling, Lighthouse 13.5.0, single page load. Lab results are estimates and can vary between runs.

The main finding

The page is stable (no layout shift, no blocking scripts after load) but the biggest visible element takes about 10.8 seconds to appear on a throttled phone. PageSpeed estimates 2,340 ms from render-blocking requests alone, plus 185 KiB from image delivery. These are fixable without changing how the site looks or how the clinic works.

2. Screenshot evidence

PageSpeed Insights, mobile, captured 10 Oct 2026, 9:32 PM. Scores and metrics.

Insights list: render-blocking requests (est. 2,340 ms), image delivery (185 KiB), cache lifetimes (44 KiB), forced reflow, LCP breakdown and request discovery, network dependency tree.

3. Issues and fixes

Items marked "to verify" were not confirmed from raw page code and are not stated as facts.

Area	Finding	Priority	Recommended fix
Speed	LCP is 10.8 s, Speed Index 8.4 s, FCP 3.2 s on mobile.	High	Find the LCP element, preload it, compress and serve it as WebP/AVIF at the right size.
Speed	Render-blocking requests, estimated saving 2,340 ms (PageSpeed).	High	Inline critical CSS, defer non-critical CSS and JavaScript.
Speed	Image delivery: estimated saving 185 KiB.	Medium	Responsive sizes, modern formats, lazy-load images below the fold.
Speed	Efficient cache lifetimes: estimated saving 44 KiB.	Medium	Long cache headers for static files (fonts, images, CSS, JS).
Speed	Unused CSS: estimated saving 28 KiB.	Low	Load shop/cart styles only on shop pages (to verify which files).
SEO	PageSpeed reports no meta description. The page title is only "Shenton Dental".	High	Write a description and a title that include dental, Singapore and Coleman St / The Adelphi.
SEO	Local business structured data (Dentist schema).	Medium	To verify. Add Dentist / LocalBusiness schema with address, phones and services.
Trust	Footer text reads "Mockup for demonstration purposes." on the live page.	High	To verify in a browser. Remove if it is left over from development.
Reliability	The Crowns & Bridges video loads from a staging address (zippy-staging6.theshin.info), not from the clinic domain.	High	Move the video to the clinic media library, compress it, and poster-frame it.
Content	Subsidy information (CHAS, Merdeka, PG prices) is shown as a poster image.	Medium	Add it as real text so patients and Google can read it. See the demo.
Accessibility	Heading order is not sequential; aria-hidden elements contain focusable items.	Medium	Fix heading levels; remove focusable children from aria-hidden regions.
Accessibility	Several images (clinic rooms, poster, partner logos) appeared without alt text when the page was read.	Medium	To verify exact count in raw HTML, then add descriptive alt text.
Quality	Browser errors are logged to the console (Best Practices).	Low	Open DevTools, list the errors, fix the failing scripts.
Agents	Accessibility tree not well-formed (Agentic Browsing 1/2).	Low	Clean markup so AI assistants can read the page and the booking form.
Booking	The form promises confirmation by email within one business day.	Medium	Add instant confirmation and WhatsApp reminders; handle after-hours enquiries.

4. UI review

Mobile first screen. The PageSpeed preview shows the clinic name, a short introduction, a "Book an Appointment" button and the start of the booking form, with a floating WhatsApp button. The message is clear and the action is obvious.

Booking form on the homepage. The form asks for name, email, number, service, symptoms, date and time. It is helpful for ready patients, but on a phone it pushes services and doctors down the page. A shorter first step (service and preferred time) with the rest on the booking page would keep the page lighter.

Subsidy prices. CHAS, Merdeka and PG scaling and polishing prices are among the most useful facts for local patients, yet they sit in a poster image. Turning them into a small interactive price checker is the one change we would make most visible (see demo).

Shop. A WooCommerce shop and cart are part of the navigation. Whether it is actively used is not known; it is worth confirming, since it adds scripts and styles to every page.

5. What already works well

- Clear introduction and a booking button visible at the top of the page.
- Six verified Google reviews displayed on the homepage, which build trust quickly.
- Doctor profiles with qualifications: Dr. Rosalind Ho (over 30 years in general dentistry) and Dr. Oh Xue Ling.
- Clear services list with a page for each treatment.
- Government subsidy and insurer information is present, and a WhatsApp shortcut is available.
- Good scores for Accessibility (95), Best Practices (96) and SEO (92), no layout shift (CLS 0.001) and no blocking time (0 ms).

6. Four-week action plan

Week	Focus	What we do
Week 1	Speed foundation	Find and optimise the LCP element, compress images, set cache headers, remove render-blocking CSS/JS. Re-test on PageSpeed.
Week 2	Search visibility	New title and meta description, Dentist schema, alt texts, heading order. Move the video off the staging address and remove leftover text.
Week 3	Subsidy price checker and booking	Add the CHAS / Merdeka / PG price section as real text. Simplify the homepage booking step.
Week 4	Patient handling	Instant booking confirmation, WhatsApp reminders and an AI assistant for after-hours calls and enquiries. Final re-test and handover.

The work can be done in phases, so the clinic can start with the speed and search fixes and add booking automation later. Pricing for each phase is shared after a short call.

7. Demo

We built a homepage demo using the clinic's own text, doctors and photos, with a subsidy price checker as its main feature:

<https://softosync.github.io/client-demos/shenton-dental/>

It is a design demonstration only. Prices shown are those listed on the clinic's current website.

8. Next steps

A short call or online meeting (15 to 20 minutes) is enough to walk through this report and the demo. You can also write to us on WhatsApp Business at **+92 308 2615761** or call the same number, whichever is easier. Email: zain@softosync.com. Portfolio: softosync.com/portfolio
