AUTOMATION CONCEPT / 27 OCTOBER 2026

Desert Fox Tourism & Trips

AI-assisted tour enquiries and booking workflow

A practical plan to make enquiries easier to capture, qualify and hand over, while preserving your team's control over quotes, availability and bookings.

THE OPPORTUNITY

Connect your broad tour catalogue to a consistent intake flow that captures the details staff need.

A PROPOSED PILOT

Start with one enquiry channel and an approved answer set; expand only after the team validates it.

Prepared for Desert Fox Tourism and Trips | Doha, Qatar

Research and mobile Lighthouse audit: 27 October 2026

Business understanding and audit

Your official site presents Desert Fox as an adventure-focused tourism company and lists Doha city and museum tours, shopping, dhow trips, North Qatar, kayaking, desert safari and paratrike. The services page also covers group and family trips, team-building, events, yacht experiences and corporate hotel reservations.

Foundations to preserve

- Clear range of experiences for different interests and group types.
- Flexible timing: preferred tour timings can be requested.
- Direct contact: public phone numbers, business emails and a booking enquiry form.
- Mobile SEO 91/100 and Best Practices 92/100 are strong baseline signals.

Verified mobile Lighthouse audit - 27 October 2026

CATEGORY	SCORE	OBSERVATION
Performance	66/100	LCP 9.2 s; FCP 3.0 s.
Accessibility	73/100	Contrast, page language, navigation link naming and zoom settings flagged.
Best Practices	92/100	Console errors and responsive image sizing flagged.
SEO	91/100	Meta description missing in the audit.

The lab run transferred 16.4 MiB across 79 requests, including a 12.6 MiB media item and 3.5 MiB of images. Lighthouse flagged cache opportunities (up to 3.6 MiB), image delivery (up to 2.3 MiB) and render-blocking requests (estimated 2.6 s FCP savings).

These are lab diagnostics, not a guarantee of identical savings for every visitor.

The homepage footer still shows a 2020 copyright year. Tour pages were not all consistently accessible to the research crawler, so this plan assumes no unpublished pricing, live inventory or existing booking-system integration.

A guided enquiry flow, not a black box

Softosync proposes an AI-assisted intake and follow-up workflow that supports the existing booking form and your preferred customer channels. It captures consistent details, prepares a structured enquiry for staff, and routes anything requiring judgement to a person.

01 CAPTURE	02 QUALIFY	03 HAND OFF
Start with the website form or one agreed channel.	Ask tour, date/time, group size, pickup, language and needs.	Create a lead record and notify the right team member.

Suggested pilot components

- Approved answer set: use only tour descriptions, enquiry requirements and policies your team approves.
- Structured enquiry record: channel, requested experience, date/time, party size, pickup details, contact information and status.
- AI Calling Agent option: triage or callback support for missed/after-hours enquiries, subject to approved scripts, consent rules and telephony setup.
- Human handoff for price exceptions, availability, cancellations, weather changes or anything uncertain - no guessing.
- Simple reporting on enquiry source, first-response time and follow-up status.

CONTROL PRINCIPLE

The assistant must not promise availability, final prices, confirmations or policy exceptions unless they come from an approved live system. Staff confirm all bookings in the first pilot.

Integration scope is confirmed during discovery. WhatsApp Business API, CRM, calendar, booking engine or telephony connections depend on your current systems and authorized access.

Small pilot, measured rollout

PHASE	WORK	OUTPUT
Week 1	Map enquiry sources, handoff, approved policies and esca lation rules.	Workflow map.
Week 2	Design questions, lead fields, staff notifications and s ample conversations.	Reviewed prototype.
Weeks 3-4	Build chosen channel and lead capture, subject to system access.	Pilot-ready workflow.
Week 5	Test realistic cases, fallback paths, consent and report ing; train staff.	Pilot review plan.

Why Softosync

Softosync builds AI automation, custom software, mobile and web experiences. Our portfolio includes Insight Guard (AI alert detection), WeDissect (AI-assisted screening workflow) and MindMesh (a conversational assistant) - relevant experience with structured intake and AI-supported workflows.

Recommended next steps

- Confirm the highest-volume enquiry type and the channels your team already uses.
- Approve the answer set, required lead fields, handoff owner and escalation rules.
- Choose a narrow pilot and baseline response time and enquiry completeness.

Concept only; final scope and timing depend on discovery, approvals, system access and testing.
No live booking, pricing or availability integration is assumed in this proposal.
