What is already working

Your official site presents Desert Fox as an adventure-focused tourism company and lists a wide catalogue: Doha city and museum tours, shopping, traditional wooden dhow trips, North Qatar, kayaking, desert safari and paratrike. The services page also describes sightseeing with or without a guide, group and family trips, team-building activities, events, yacht experiences and corporate hotel reservations.

The site already has useful foundations to preserve:

- Clear range of experiences: visitors can see options for different interests and group types.
- Flexible timing: the services page says preferred tour timings can be requested.
- Direct contact: the homepage publishes phone numbers and business email addresses, and includes a booking enquiry form.
- Strong baseline search signals: mobile SEO scored 91/100 and Best Practices scored 92/100 in this run.

Verified mobile audit - 27 October 2026

CATEGORY	SCORE	OBSERVATION
Performance	66/100	Largest Contentful Paint: 9.2 s; First Contentful Paint: 3.0 s.
Accessibility	73/100	Contrast, page language, navigation link naming and zoom configuration were flagged.
Best Practices	92/100	Strong overall score; console errors and responsive image sizing were flagged.
SEO	91/100	A meta description was missing in the audit.

The page transferred 16.4 MiB across 79 requests in the lab run, including a 12.6 MiB media item and 3.5 MiB of images. Lighthouse identified opportunities around cache lifetimes (up to 3.6 MiB), image delivery (up to 2.3 MiB) and render-blocking requests (estimated 2.6 s FCP savings). These are lab diagnostics, not a guarantee of the same saving for every visitor.

Other verified detail: the homepage footer still shows a 2020 copyright year. The tour pages were not all consistently accessible to the research crawler, so this plan does not assume any unpublished pricing, live inventory or booking-system integration.

A guided enquiry flow, not a black box

Softosync proposes an AI-assisted intake and follow-up workflow that supports the existing booking form and your preferred customer channels. It would collect a consistent set of details, prepare a structured enquiry for staff, and route anything requiring judgement to a person.

01 CAPTURE	02 QUALIFY	03 HAND OFF
Start from the existing website form or a channel agreed during discovery. Keep the initial pilot narrow.	Ask for tour type, preferred date/time, group size, pickup needs, language and any special requirements.	Create a structured lead record and notify the right team member with the conversation context attached.

Suggested pilot components

- Approved answer set: concise answers drawn only from information your team approves, such as tour descriptions, enquiry requirements and published policies.
- Structured enquiry record: one record per request with channel, requested experience, date/time, party size, pickup details, contact information and status.
- AI Calling Agent option: triage or callback assistance for missed/after-hours enquiries, subject to consent rules, approved scripts and the telephony setup you choose.
- Human handoff: route price exceptions, availability checks, cancellations, weather-related changes and anything uncertain to staff instead of guessing.
- Operational visibility: simple reporting on enquiry source, time to first response, missing details and follow-up status.

Control principle
The assistant should not promise availability, final prices, confirmations or policy exceptions unless those facts come from an approved live system. The first pilot can capture requests only; staff remain responsible for confirming bookings.

Integration scope would be confirmed during discovery. Any WhatsApp Business API, CRM, calendar, booking engine or telephony connection depends on the system you use and the access you authorize.
